LUIS GUSTAVO DE MELO GOMES

MID-LEVEL FULLSTACK DEVELOPER

SERRINHA – BA, BRAZIL

EMAIL: gomesluis.dev@gmail.com | LINKEDIN: www.linkedin.com/in/gomes-luis

PORTFOLIO: https://luisgomes-mu.vercel.app/ | GITHUB: https://github.com/luisgomes2002

I am a FullStack developer with 3 years of experience, with a stronger focus on the backend. In recent years, I have worked with **React** and **React Native** with **TypeScript** for frontend and mobile, and **Node.js**, **Express**, with **TypeScript**, **Java**, and **Spring Boot** on the backend. I also use AI on two fronts: integrating LLMs into products, with **Spring AI** and **OpenAI** in Murasaki, and in my development process, with coding agents (**Claude Code**, **Codex**), my own skills and subagents, and **MCP** servers.

PROFESSIONAL EXPERIENCE

Sep 2024 - Present · ZTHA Computação **- Web and Mobile Developer**

- Lead developer of **Ecosys**, a management platform for agricultural cooperatives with a web admin panel, an API, and a mobile app for producers to sell their products. The backend uses **Java** with **Spring Boot**, **PostgreSQL**, **Redis**, **Flyway** for migrations, **JWT** authentication, rate limiting with **Bucket4j**, **MapStruct**, and **AspectJ**, running on **Docker**. The web app is built with **React**, **TypeScript**, **Recharts**, and **Leaflet**, and the mobile app with **React Native** and **Expo**. Currently migrating the API to **CQRS** with **Event Sourcing**: an event store in **PostgreSQL** keeps the full history of animals, plants, products, and the financial ledger, events are published with **Debezium** and **Kafka**, read screens come from **MongoDB** projections, and analytics from **ClickHouse**.
- Development of the API for **Caderneta Digital**, a digital credit union fintech with accounts, loans, investments, and cards. The API is built with **Java**, **Spring Boot**, and **PostgreSQL**, organized as a **modular monolith** with **Clean Architecture**. I also contributed to the mobile app in **React Native** with **Expo**.
- Development of the API and front-end of **ZTHA Acessos**, an internal portal to request, approve, and grant access to credentials and repositories, with full revocation on offboarding and an auditable history. It uses **Express**, **Prisma**, and **PostgreSQL** on the backend, **Next.js** with **Tailwind CSS** on the front-end, and **Docker**.
- Development of the centralized authentication app for the Ztha ecosystem in **React Native** with **TypeScript**, with **2FA (TOTP)**, biometrics, and QR Code scanning. I also contributed to the API in **Node.js** with **Fastify**, **Prisma ORM**, **PostgreSQL**, **JWT**, and data validation with **Zod**.

Side Projects

1. **(Production project)** Murasaki Languages, a Japanese learning platform. The frontend uses **React** and **Vite** with **TypeScript**, with **Zod** for validation. The backend uses **Java Spring Boot** following **Clean Architecture**, with **MongoDB** for persistence and **Redis** for cache. The application integrates LLMs through **Spring AI** and **OpenAI** (**GPT-4.1** and **GPT-4.1-mini**, with the model chosen per task to control cost): text read by OCR with **Google Vision AI** goes through morphological tokenization with **Sudachi** and is refined by the AI, which also generates dictionary entries, explains sentences, translates grammar content, and creates personalized study reports, with per-user usage quotas and a deterministic AI gateway so E2E tests spend no tokens. It has payments with **Stripe** and storage on **Google Cloud Storage**. The infrastructure uses **NGINX** and **Docker**, with monitoring by **Prometheus** and **Grafana** and deployment through **CI/CD**. I am also building a Chrome extension integrated with the platform that tracks immersion time while watching YouTube videos.

2. **(Production project)** Freelance work for Hotel Ellus: a desktop hotel management system with modules for reservations, rooms, guests, reports, and auditing. Built with **Electron**, **React** with **TypeScript**, **SQLite**, **Zustand**, **Zod**, **React Hook Form**, and **TanStack Table**.

3. **(Production project)** Sagyou, an open source personal organization app for PC and mobile. The desktop app uses **Electron**, **React**, **TypeScript**, and **SQLite**, and the Android app uses **React Native** with **Expo**. Sync goes through a server on **Cloudflare Workers** with **D1** and has **end-to-end encryption**, so the server never sees the content. For security, devices are paired by QR Code and protected with **2FA (TOTP)** and biometrics. The app opens coding agent sessions (**Claude Code**, **Codex**, **OpenCode**) in **isolated Git worktrees** and gives them access to the data through its own **MCP server**, with a temporary per-session credential and human approval for sensitive actions. I also built the agents' **Memory** system: decisions and context kept across sessions, with **FTS5** search, usage-based decay, automatic secret removal, and a summary at the end of each session. Finally, it uses an **ESP32** with **Wake-on-LAN** to turn on the PC from the phone.

EDUCATION

Bachelor’s Degree in **Computer Engineering** 2025 – UNIFACS

ADDITIONAL EDUCATION

- **Java** Certification – Java10x
- **Spring Boot** Certification – Java10x

LANGUAGES

- Portuguese: Native
- English: Intermediate
- Japanese: Intermediate
- Korean: Basic
